

Beach Prisms™: The Answer to Shoreline Erosion?

After 18 years of successful product testing in the field, Beach Prisms™ are now available to customers for sale and installation.

Erosion control is important to anyone with assets along the shoreline. This includes companies with buildings and other valuable equipment located in erosion-prone areas, such as utility companies, public works, parks and recreation sites, and private property owners.

Beach Prisms™ are permeable, pre-cast concrete products that reduce the amount of energy in incoming waves before they reach the shoreline.

A recent study by Lane Engineering Inc. conducted at a Chesapeake Bay test site reports 7,465 tons of sand were replenished onto the beach as a result of the installation.
